

# 4 Domains API: How to retrieve TLD specific data

*This is a series of articles dedicated to demonstrating how to get acquainted with Openprovider Domains API methods. To get more information about our API in general, please use our [documentation portal](#) as your reference.*

Additional domain fields (also commonly referred to as Extended Attributes) define the information required by domain registries for a given TLD.

While most extensions can be registered with just the basic contact data (company name, contact name, address, telephone number, and e-mail address), several extensions require additional contact information in order to register a domain name. When a domain registry requires the information, a domain name will fail to register successfully unless the values are provided.

Typical information requested by domain registries includes things such as Registrant Legal Type, Registered Entity Name, etc.

↓ Use the endpoint path below. The base URL is determined by both the target environment and the API version.

```
GET {base_url}/domains/additional-data
```

## REQUEST VALUES

| Name             | Type   | Description      |
|------------------|--------|------------------|
| domain.extension | string | <b>Required.</b> |

## REQUEST EXAMPLE

```
curl -X GET \  
  'https://api.openprovider.eu/v1beta/domains/additional-data?domain.extension=no' \  
  -H 'Authorization: Bearer eca82663f*****76d063d8f6196' \  
  \
```

## RESPONSE EXAMPLE

```
{
  "code": 0,
  "desc": "",
  "data": [
    {
      "name": "company_registration_number",
      "description": "Company registration number. Required in case if domain requester is a legal e",
      "required": false,
      "type": "text"
    },
    {
      "name": "company_registration_number",
      "description": "Company registration number. Required in case if domain requester is a legal e",
      "required": false,
      "type": "text"
    }
  ]
}
```
