

Changing the owner of a domain name

Question

How to change the owner of a domain name?

Answer

The owner of a domain name can generally be changed through RCP by simply going to [Domain Management](#) and editing the domain owner handle. Please check the [TLD documentation](#) to check on the procedure for the domain name you are trying to trade.

Some TLDs allow to change the owner of a domain name by navigating to the domain name and clicking **Edit** on the top-right of the page. On the following page you can replace the owner as if you were registering a new domain and then click the **Save** button on the bottom-right.

Other TLDs however do not allow you to change the owner this easily, a special procedure is required in these cases. This procedure can be initiated by navigating to [Trade](#) in the control panel and inserting the domain name.

Please check our [TLD documentation](#) for the procedure concerning your trade to make sure you know what to expect.

How to update domains in a bulk from one registrant?

It is possible to change the owner of some domains at the same time from [Domain management / Bulk operations](#). By clicking on **Start New / Modify domains** you will be able to add a list of domains and then update the owner in bulk.
