

How to schedule a domain transfer

Question

Is it possible to *schedule* a transfer?

Answer

Scheduling a transfer can minimize the risk of paying twice for the registration same period when consolidating domains.

To schedule a transfer, simply choose a date (**Transfer on**) to transfer via the dropdown next to the **Authorization code** field.

Transfer

The screenshot displays a domain transfer interface. At the top, a table lists domain details:

Domain	Price	Authorization code	Transfer on
test.com	\$ 9.77 (€ 9.55)		

Below the table, a yellow message box states: "The authorization code can be requested at the current registrar".

The "Contact data" section includes the instruction: "Define the owner and contact persons of these domains. Fields with an asterisk (*) are mandatory." It contains two input fields: "Domain owner" and "Administrative contact", both with placeholder text "Start typing or create new customer". A checkbox labeled "Equal to domain owner" is checked.

A calendar widget is overlaid on the right side, showing February 2024. The date 6 is highlighted in orange.

Do keep in mind that many TLDs have a **limited** validity period for their authorization codes.

Please, be aware that the time mentioned in our emails and in the control panel are CET.
But this only indicates from what time the domain will be added in our transfer or renewal scripts.

If the time indication would say 03:00 AM, it does not mean that exactly at 3 in the morning the transfer will start. It means that from 3 in the morning, the domain is added to our transfer script.

We process the requests in batches, to make sure it is well divided in terms of load for the system to process. Therefore it can happen that your transfer will start for example 2 hours later then the time mentioned in the control panel or email.
