

Email Solution - Invalid owner handle!

You may encounter the error "**Invalid owner handle!**" when trying to add a domain to the email service.

If the domain is registered through Openprovider, the handle used to add the domain to email service must match the domain's **registrant handle (owner handle)**. Using a different handle will trigger the error.

For domains registered with other providers, this validation does not apply. You can use any handle under your account when adding the domain to the email service.
