

What are domain aliases in SpamExperts?

Question

What are domain aliases in SpamExperts?

Answer

You can configure an unlimited number of domain aliases for a domain filter. All email traffic sent to these aliases will be filtered. Spam messages will stay quarantined in SpamExperts, and all legitimate email will be delivered to the main domain.

Domain aliases do not have separate access to the Domain Level Control Panel. Since all SMTP traffic to the domain alias is rewritten to the main domain, any changes/lookups on the main domain will simply include the alias domain traffic as if it was sent directly to the main domain. If you are searching for a specific email sent to a domain alias using the Log Search, the recipient will therefore show as **user@maindomain**.

Note: When adding a domain alias, the MX-records are not updated automatically and have to be set manually to the same MX-records as the main domain.

Example case:

- You configured the filter for *example.com*, using mail server *mail.example.com*
- For this domain, you add *otherdomain.com* as an alias
- An email sent to *info@otherdomain.com* will be examined by SpamExperts filter and delivered to **info@example.com**
- The *To* field in the email header will show the original e-mail address

Aliases

Domain aliases do not have separate access to the Domain Level Control Panel.

Since all SMTP traffic to the domain alias is rewritten to the main domain, any changes/lookups on the main domain will simply include the alias domain traffic as if it was sent directly to the main domain.

If you are searching for a specific email sent to a domain alias using the Log Search, the recipient will therefore show as [user@maindomain](#).

Note: When adding a domain alias, the MX-records are not updated automatically and have to be set manually to the same MX-records as the main domain.
